1. If not preassembled, assemble the disk, bracket and bolt loosely so there is lots of movement in the bracket. Position the offset bracket so the bottom protrudes below the disk.

2. Hold the disk between your thumb and forefinger.

3. Insert the bottom of the bracket into the hole then slide the disk to the desired location.

4. Using a 5/16" wrench hold the disk in the desired position and tighten the bolt.
